React Developer Tools lets you inspect the React component hierarchy (React tree), including component props and state.

https://github.com/facebook/react-devtools

It is created by Facebook.

It exists both as a browser extension (for Chrome and Firefox), and as a standalone app (works with other environments including Safari, IE, and React Native).

The extension icon in the browser will light up on the websites using React.

The extension adds a new tab called "React" to chrome developer tools.

The React tab won't show up if the site doesn't use React.

Some of the actions that the extension supports are:

- Update of component props and state values.

- Search for a React element.

- Select a React UI feature to inspect it.

- Switch to the corresponding HTML DOM element in "Elements" tab or "Sources" tab.
